Abstract. This thesis explores the pedagogical significance of the STEAM (Science, Technology, Engineering, Arts, and Mathematics) approach, with a particular focus on the ART component, in the development of speech culture among preschool children. The integration of arts into the STEAM framework provides opportunities for enhancing children's expressive speech, vocabulary, creativity, and communicative competence. The study highlights theoretical foundations, pedagogical strategies, and practical outcomes of applying the STEAM (ART) approach in early childhood education. Findings indicate that this approach contributes significantly to coherent speech, linguistic enrichment, and overall communicative development in preschool-aged children.

Introduction. Preschool age is a critical period for developing a child's personality, cognitive abilities, and communicative skills. One of the most important aspects of early childhood education is the development of speech culture, which includes correct pronunciation, coherent expression, rich vocabulary, and the ability to communicate thoughts clearly and creatively. Modern educational approaches emphasize the need for innovative, interactive, and integrative methods that actively engage children in learning, rather than relying solely on traditional, teacher-centered instruction.

The STEAM approach integrates science, technology, engineering, arts, and mathematics into a unified framework that promotes creativity, problem-solving, critical thinking, and communication. The ART component within STEAM is particularly valuable for preschool education, as it fosters imagination, emotional expression, and verbal interaction. Activities such as drawing, storytelling, role-playing, dramatization, and music allow children to actively use language, expand their vocabulary, and develop coherent speech in meaningful and engaging contexts.

Applying the STEAM (ART) approach in preschool settings encourages collaborative learning, dialogic communication, and reflective thinking. Group-based

tasks require children to discuss ideas, explain their reasoning, and negotiate solutions, which enhances both expressive and receptive speech skills. Multisensory learning experiences inherent in the STEAM (ART) approach—combining visual, auditory, and kinesthetic activities—also support memory retention, pronunciation development, and active use of new vocabulary.

Despite its recognized benefits, the role of STEAM (ART) in developing speech culture among preschool children remains underexplored. Most research has focused on cognitive and creative outcomes, while the pedagogical impact on language development and communicative competence requires further investigation. This study seeks to address this gap by analyzing how the STEAM (ART) approach can be effectively integrated into preschool education to promote speech culture and holistic child development.

In conclusion, the STEAM (ART) approach represents a pedagogically significant method for fostering speech culture in early childhood. Its implementation supports expressive communication, creative thinking, and collaborative skills, contributing to the overall development of preschool-aged children. Therefore, educators are encouraged to integrate STEAM (ART) principles into curricula and to receive methodological support to maximize the effectiveness of this innovative approach.

Literature Review. The development of speech culture in preschool children has long been recognized as a critical aspect of early childhood education. Speech culture, encompassing vocabulary enrichment, coherent expression, correct pronunciation, and effective communication, forms the foundation for cognitive, social, and emotional development (Vygotsky, 1978). Socio-cultural theories highlight that children acquire language skills most effectively through meaningful social interaction and guided activity, emphasizing the importance of pedagogically structured environments. Similarly, Piaget (1962) asserts that active engagement and experiential learning play a central role in developing children's cognitive and linguistic capacities.

In recent years, the STEAM educational approach has emerged as an innovative pedagogical framework aimed at fostering creativity, critical thinking, collaboration, and communication. Yakman (2012) defines STEAM as an interdisciplinary model that integrates science, technology, engineering, arts, and mathematics to promote holistic learning. The ART component within STEAM is particularly significant in early childhood education because artistic activities naturally stimulate imagination, emotional expression, and verbal communication. Eisner (2002) emphasizes that engagement in the arts fosters symbolic thinking, creativity, and expressive language, all of which are essential for speech development.

Research indicates that integrating arts into STEM (thus forming STEAM) supports children's communicative competence and narrative skills. Storytelling, role-playing, dramatization, and drawing are examples of activities that encourage children to express ideas, describe processes, and explain outcomes verbally (Henriksen, 2017). Such activities enhance vocabulary acquisition, grammatical

accuracy, and coherent speech, while simultaneously promoting social interaction and collaborative problem-solving.

In preschool contexts, interactive and participatory learning environments have been shown to be particularly effective for speech culture development. Rogoff (2003) highlights that social participation and joint activity are central to language acquisition, suggesting that children learn best when they engage in dialogue and shared tasks. The STEAM (ART) approach, with its emphasis on collaborative, project-based learning, provides multiple opportunities for children to practice verbal communication in authentic, meaningful contexts.

While the cognitive and creative benefits of STEAM (ART) are well-documented, fewer studies have examined its specific impact on early speech development. Wright (2010) notes that although artistic activities are widely used in preschool education, systematic integration within a structured STEAM framework is often lacking. Consequently, there is a need for research that evaluates how interdisciplinary and art-integrated activities contribute to the formation of coherent speech, expressive vocabulary, and communicative confidence in young children.

Overall, existing literature suggests that the STEAM (ART) approach holds substantial potential for enhancing speech culture in preschool children. By combining creative expression with interdisciplinary learning, educators can support not only language development but also cognitive, emotional, and social growth. This underscores the pedagogical importance of implementing STEAM (ART)-based activities in early childhood education to promote holistic child development.

Conclusion. The study highlights the pedagogical significance of the STEAM (ART) approach in fostering speech culture among preschool children. Integrating arts into early childhood education provides children with opportunities to develop expressive language, vocabulary, coherent speech, and communicative competence while simultaneously enhancing creativity and problem-solving skills. The STEAM (ART) approach promotes interactive and participatory learning, where children actively engage in storytelling, dramatization, role-play, and collaborative projects. These activities not only strengthen verbal expression but also support social-emotional development, critical thinking, and cooperative skills. Multisensory and creative experiences inherent in the approach further enhance motivation, language acquisition, and cognitive growth. Overall, STEAM (ART) represents a valuable pedagogical tool for preschool educators. Its systematic implementation contributes to holistic child development, combining linguistic, cognitive, social, and creative growth. Therefore, early childhood educators are encouraged to integrate STEAM (ART) principles into curricula and receive appropriate methodological training to maximize its effectiveness in developing speech culture.
