**Key words:**
technology education, digital pedagogy, digital tools, educational technology, blended learning, constructivism, project-based learning, interactive learning, digital competence, teacher training.

**Abstract**
This article examines the scientific and methodological foundations for implementing digital pedagogical technologies in technology education. It highlights the role of digital tools in enhancing student engagement, fostering creativity, and developing practical skills through interactive and project-based learning approaches. The study analyzes educational theories such as constructivism and connectivism to justify the integration of digital methods into the curriculum. Additionally, it discusses the challenges of implementation, including teacher preparedness and infrastructure limitations, while offering strategies for effective application in both primary and secondary education settings.

**Introduction.** In the 21st century, the role of digital technologies in the educational process is growing exponentially. In an era when innovative approaches are being used at all stages of education, technological science is becoming more effective and interesting through digital means. In the Republic of Uzbekistan, the formation of a digital educational environment, the use of electronic resources, the introduction of multimedia and interactive platforms has become a priority area of state policy. Therefore, researching the scientific and methodological foundations of the introduction of digital pedagogical technologies in technological science is one of the urgent tasks.

**The role of digital pedagogical technologies in technology education.** Digital pedagogical technologies refer to the use of digital tools and platforms to enhance the teaching and learning process. In technology education, these tools help simulate industrial processes, visualize complex mechanisms, and offer hands-on experiences in a virtual environment.

Key benefits include:

- Personalization of learning

- Immediate feedback and assessment
- Simulation of real-life scenarios
- Remote access to resources and collaborative tools

Examples:

The integration of digital technologies into pedagogy is grounded in several educational theories:

- Constructivism: Learners actively construct knowledge through experience; digital tools provide simulations and exploratory environments for this.
- Connectivism: Emphasizes learning through networks; digital platforms enable peer-to-peer and student-teacher connectivity.
- Bloom's Digital Taxonomy: Updates traditional Bloom's taxonomy to reflect digital behaviors such as blogging, coding, and video creation.

These theories support the idea that digital tools are not supplementary but integral to modern teaching strategies. The methodological foundation lies in developing a structured, purposeful integration plan that aligns with curriculum goals. Key components include:

- Curriculum alignment: Ensuring digital activities support learning outcomes in technology education.
- Teacher training: Equipping educators with the skills to select and apply digital tools effectively.
- Blended learning: Combining traditional classroom teaching with digital tools to optimize instruction.
- Project-based learning (PBL): Integrating digital tools into student projects that require critical thinking and technical application.

Overcoming these challenges requires institutional support, policy-level initiatives, and continuous professional development for educators. A case study conducted in a primary school showed that using a digital drawing tool and 3D modeling software in the "Technology and Design" curriculum increased student engagement and improved spatial thinking skills. Teachers used a flipped classroom model where students watched video tutorials at home and practiced skills in class using tablets and interactive whiteboards. The integration of digital pedagogical technologies in technology education is both a necessity and an opportunity. Scientifically grounded and methodologically sound implementation fosters a more engaging, personalized, and future-ready learning environment. With proper planning, teacher training, and curriculum

development, digital tools can transform technology education into a dynamic platform for creativity, innovation, and skill development.

**Literature review**. In recent years, a number of scientific studies have been carried out on the digitalization of technology education. For example, at the international level, the works of J. Anderson, M. Prensky, S. Papert are devoted to the issues of digital competence, the “digital generation” and computerization in education. Uzbek researchers S. Sodiqov, M. Khudoyberdiev and N. Abdullayeva in their works have highlighted the effectiveness of interactive methods, the use of electronic platforms and ICT tools. Nevertheless, there is a need for in-depth research into the theoretical and practical foundations of the introduction of digital pedagogical technologies in teaching technology.

**Main part.** Technology digital pedagogy in science from technologies of use advantages in the following manifestation will be:

1. Visualization capabilities – 3D modeling, virtual laboratories, graphics programs through complicated processes simple in appearance explanation.
2. Interactivity – online tests, simulations, electronics textbooks through student activity activation.
3. Creative skills development – on digital platforms project and startup developments done increase opportunity.
4. Flexible education – individual training pace and interest adapted electronic from resources use.

Digital technologies effective current to grow for following methodical approaches important is :

education digital content process based on design;

teacher and student between online communication on the road to put;

to develop digital literacy and media culture in students;

traditional lesson methods with numerical methods integration to do.

**Research discussion.** The findings of this study highlight the increasing relevance and necessity of integrating digital pedagogical technologies into technology education. As modern classrooms shift toward more interactive and student-centered learning models, digital tools serve not only as supportive resources but also as transformative elements that redefine how students engage with content and apply knowledge in practice.

One of the key observations is that digital technologies such as simulation software, coding platforms, and multimedia content significantly enhance students' understanding of complex technological concepts. These tools provide a visual and interactive representation of mechanisms and processes that are often difficult to grasp through traditional methods. For instance, using 3D modeling

software in design tasks allows students to visualize structural integrity and functionality, thereby improving spatial awareness and problem-solving abilities.

Table 1. Analytical comparison of digital pedagogical technologies in technology education

| Digital Technology | Key Features | Benefits in Technology Education | Challenges |
|---|---|---|---|
| Simulation Software | Virtual modeling and experimentation | Enhances understanding of complex concepts; safe trial environment | Requires technical skills; expensive software licenses |
| Learning Management Systems (LMS) | Centralized course delivery and assessment | Facilitates blended learning; easy tracking of student progress | Internet dependency; requires teacher training |
| Augmented Reality (AR) | Overlaying digital info onto real-world objects | Increases student engagement; interactive visualization | High development costs; hardware availability |
| Project-Based Learning Platforms | Collaborative tools for student projects | Fosters creativity, teamwork, and real-world problem solving | Time-consuming; demands careful curriculum integration |
| Gamified Learning Tools | Game-like elements for motivation and rewards | Improves motivation and engagement; promotes active learning | Risk of distraction; may not suit all learning styles |
| Coding and Robotics Kits | Hands-on programming and mechanical design | Develops logical thinking and technical skills | Costly; requires ongoing maintenance and support |

Furthermore, the research underlines the importance of project-based learning (PBL) as a methodology that aligns seamlessly with digital integration. When students engage in real-world projects using digital tools—such as building a model in. This not only develops creative competence but also prepares learners

for future careers in STEM-related fields. The discussion also brings attention to pedagogical frameworks like constructivism and connectivism, which provide a theoretical foundation for digital integration. Constructivism supports the idea that learners build knowledge actively through experiences; digital platforms and simulations provide a dynamic environment for this. Connectivism, on the other hand, emphasizes the role of networks and shared knowledge—mirrored in digital collaborative tools and online learning communities.

Despite these advantages, the study acknowledges the ongoing challenges in implementation. The digital divide remains a critical barrier, especially in under-resourced schools where access to technology is limited. Additionally, the lack of adequate teacher training in digital pedagogy results in inconsistent or superficial use of available tools. For successful implementation, educators need continuous professional development and institutional support to integrate technology meaningfully into their teaching practices.

Moreover, curriculum design must evolve to include flexibility for digital activities, rather than treating them as add-ons. This calls for a shift in assessment methods as well, recognizing creativity, digital literacy, and practical problem-solving alongside traditional academic outcomes.

**Conclusion.** Technology science digital pedagogy in teaching technologies current to grow not only students' knowledge to take process relieves, but them independent to explore, creative to activity and innovation to think directs. Therefore, technology education scientific and methodological digital resources database based on update current scientific and practical is a task.
